11.6 Cylinders and Quadric Surfaces

Cylinders

A *cylinder* is a surface generated by moving a straight line along a given planar curve while holding the line parallel to a given fixed line.

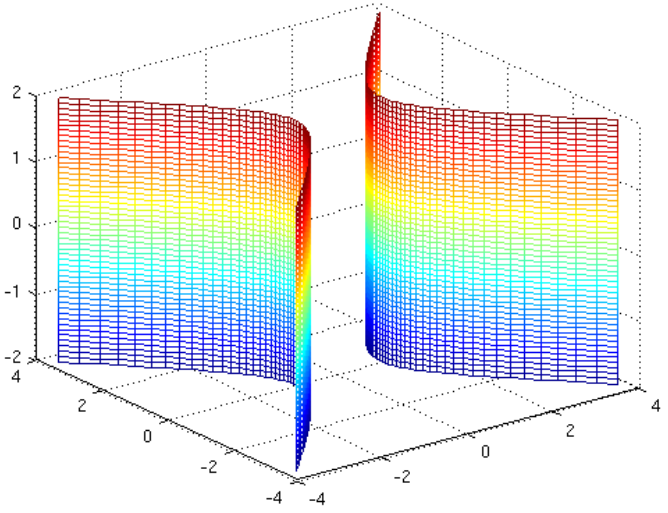

Can be represented by an equation missing one of the variables.

Parabolic Cylinder - eg. $y = x^2$

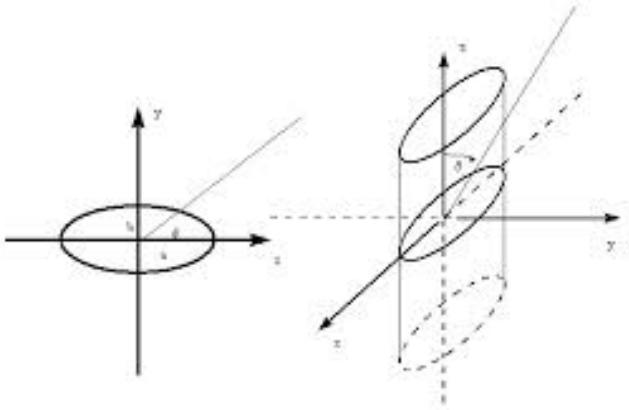

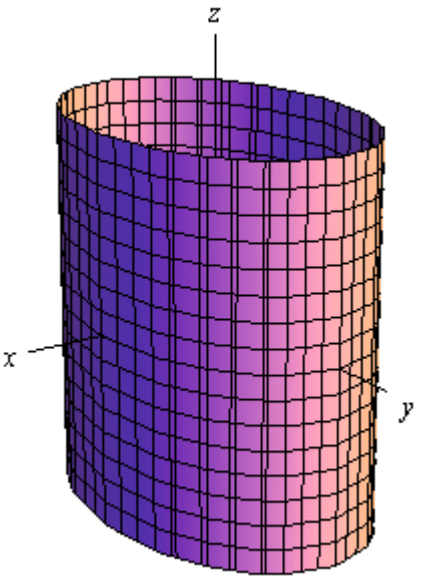

Hyperbolic Cylinder - a quadratic surface given by the equation of the form eg.

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$$

Elliptical Cylinder - A cylinder with an elliptical cross section

Quadric Surfaces

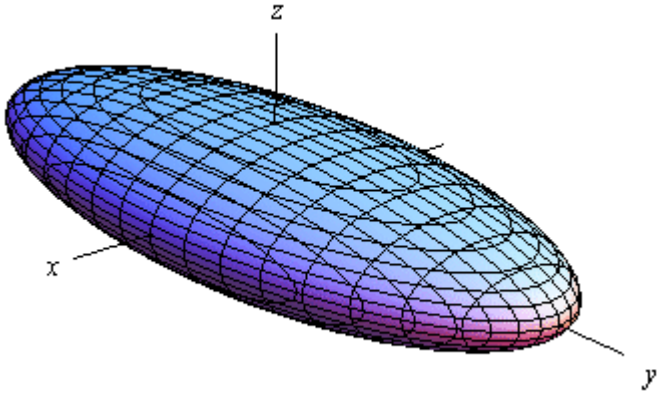

A quadric surface is the graph in space that can be put in the general form

$$Ax^2 + By^2 + Cz^2 + Dxy + Eyz + Fxz + Gx + Hy + Iz + J = 0,$$

where $A, ..., J$ are constants.

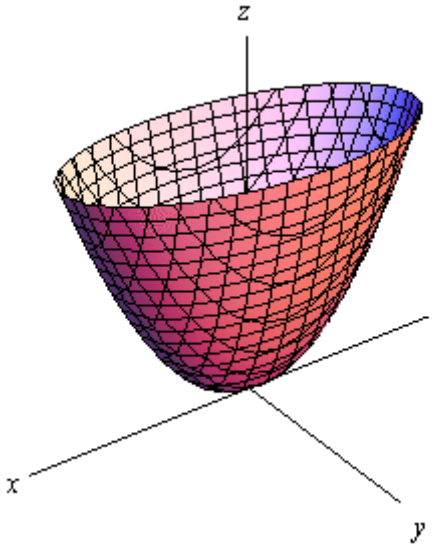

Note: A cylinder surface is also a quadric surface.

Ellipsoid - $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$

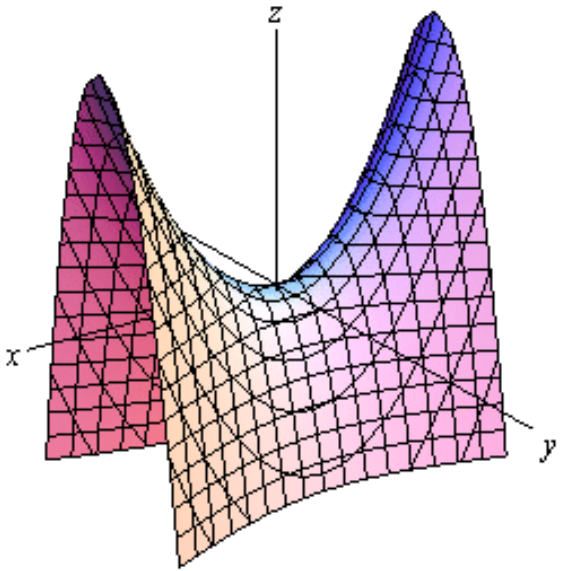

If $a = b = c$, it is a sphere.

Elliptical Paraboloid - $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z}{c}$

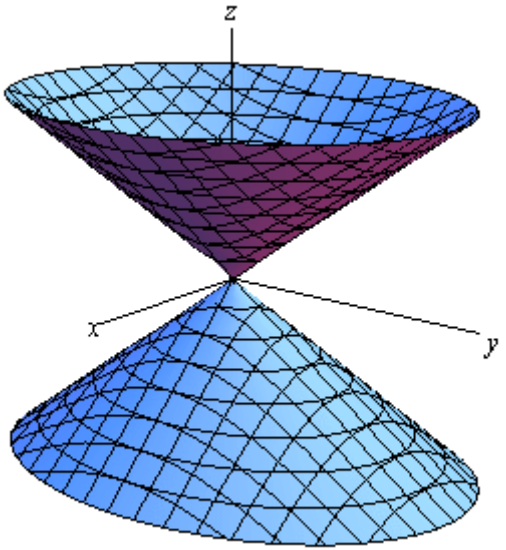

When $a = b$, it will have a cross section of a circle.

Hyperbolic Paraboloid - $\frac{x^2}{a^2} - \frac{y^2}{b^2} = \frac{z}{c}$

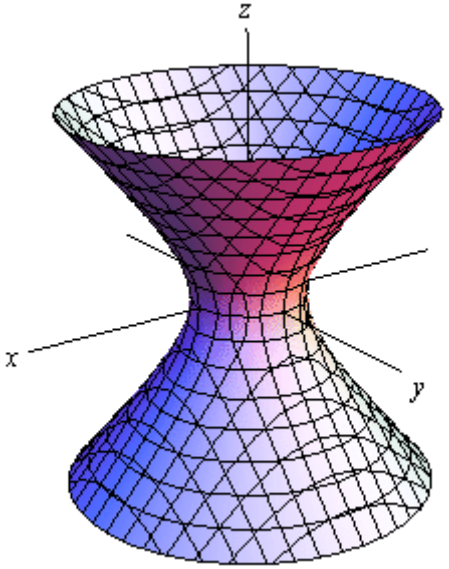

Elliptical Cone - $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z^2}{c^2}$

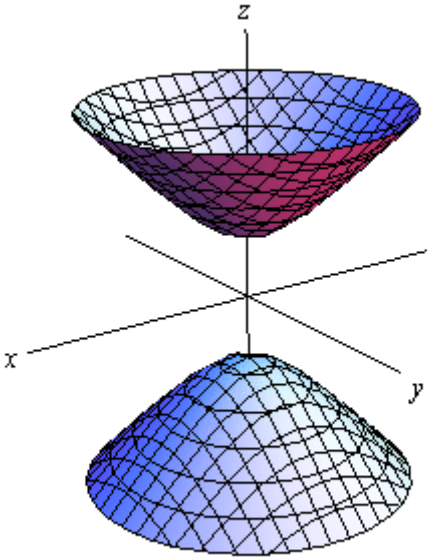

Note that this is a cone open along z-axis. Can also have cones open along x-axis (and y -axis) -

$$\frac{y^2}{b^2} + \frac{z^2}{c^2} = \frac{x^2}{a^2}$$

Hyperboloid of one sheet - $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$

Hyperboloid of two sheet - $-\frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$
