Fundamentals of Spreadsheets / Introduction to Worksheet

Lecture 1: Introduction to Excel

By

Assoc. Prof. Dr Noor Fadiya Mohd Noor

Institute of Mathematical Sciences

Objectives

- To differentiate between a spreadsheet, a workbook and a worksheet.
- To familiarize with Excel menu, tool bars and cells.
- To operate basic operators in Excel.

Original notes by NFM Noor

What is Spreadsheet?

- A type of program application that manipulates numerical and string data in rows and columns of cells.
- The value in a cell can be calculated from a formula which can involve other cells.
- A value is recalculated automatically whenever a value on which it depends changes.
- Different cells may be displayed with different formats.

Original notes by NFM Noor

What is Workbook?

- A booklet containing pages where a student may work directly on to do exercise.
- A book containing manual of operating instructions and guidelines.
- A book in which a record is kept of work proposed or accomplished.

Original notes by NFM Noor

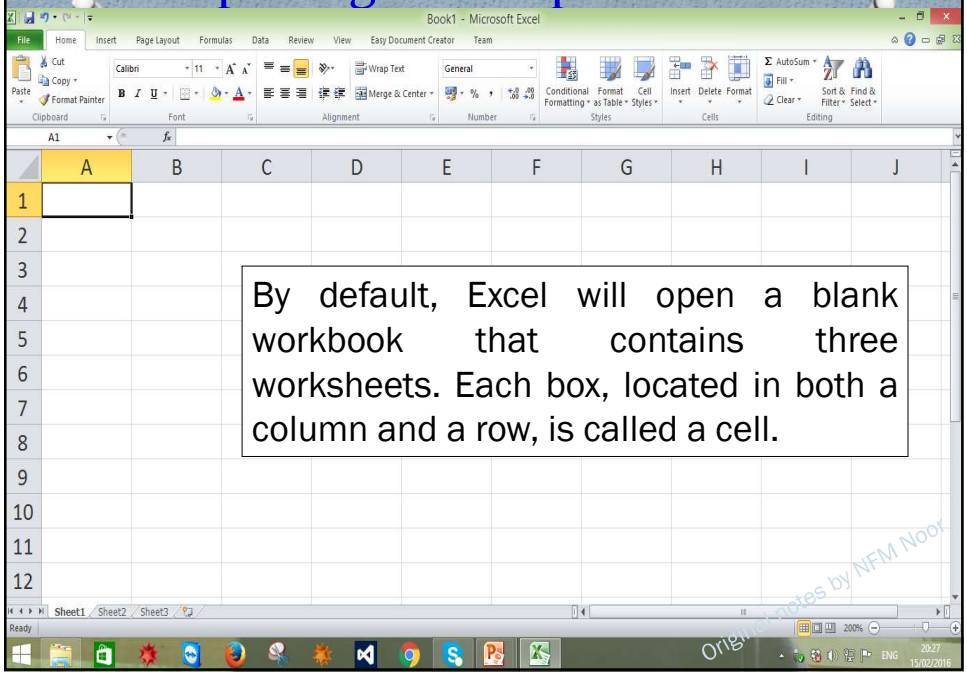

What is Worksheet?

- A sheet of multiple rows and columns used to assemble/manage figures and data.
- Normally used by accountant/analyst to prepare financial statement/basic numerical analysis.
- Pages where works planned or done on a project are recorded.

Opening Excel Spreadsheet

By default, Excel will open a blank workbook that contains three worksheets. Each box, located in both a column and a row, is called a cell.

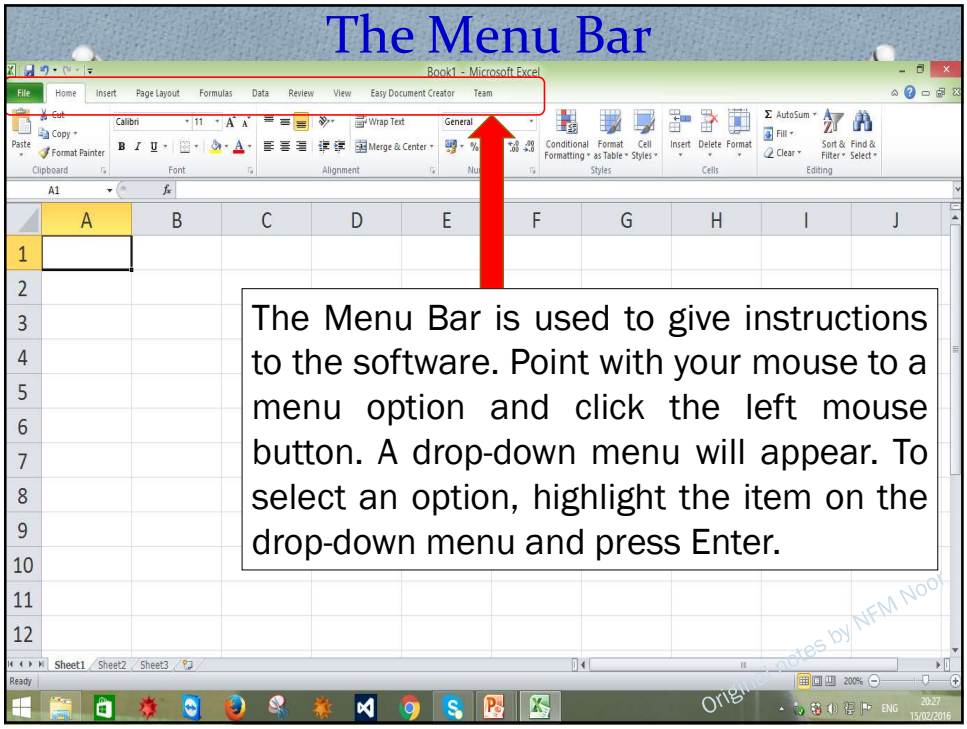

Original notes by NFM Noor

The Title Bar

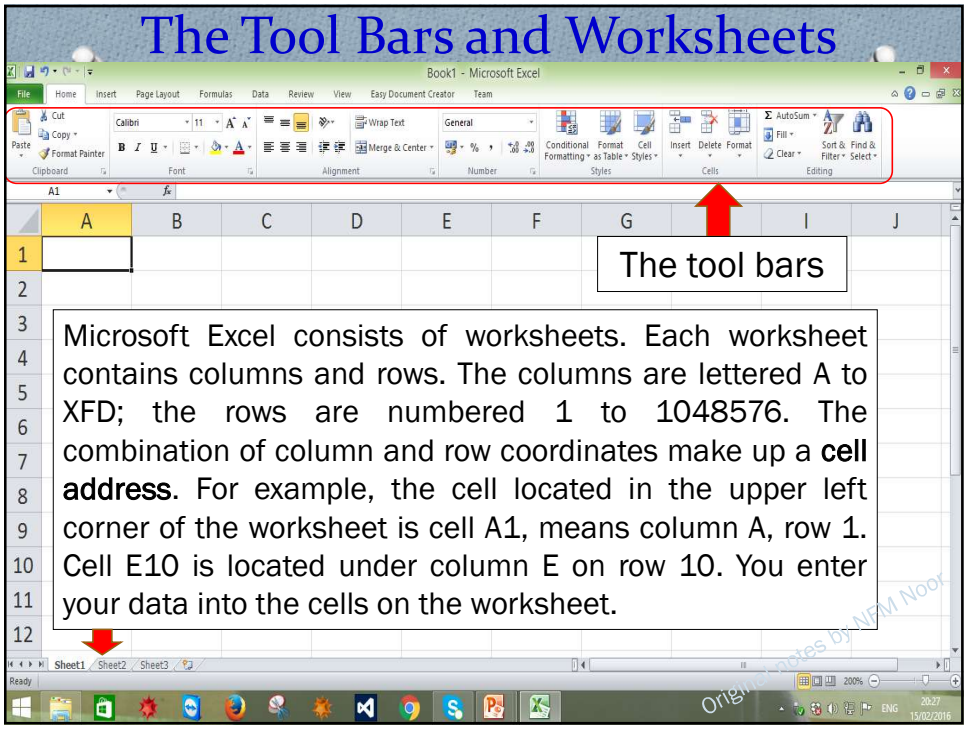

The Title Bar is located at the very top of the screen. On the Title bar, Microsoft Excel displays the name of the workbook you are currently using. At the top of your screen, you should see “Book1 - Microsoft Excel " or a similar name.

The Menu Bar

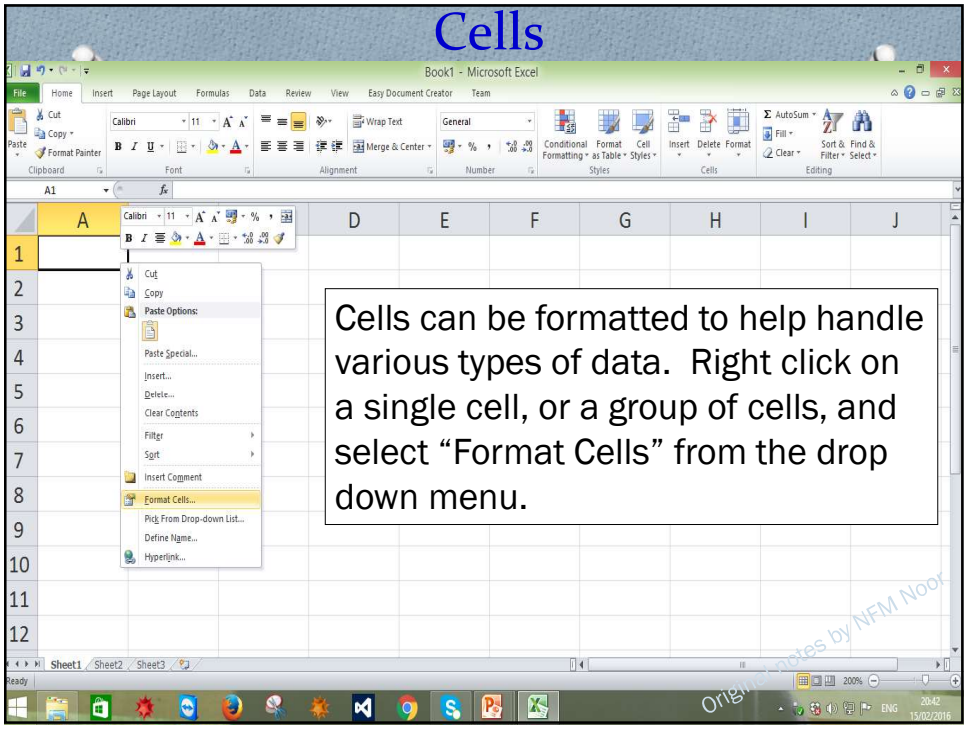

The Menu Bar is used to give instructions to the software. Point with your mouse to a menu option and click the left mouse button. A drop-down menu will appear. To select an option, highlight the item on the drop-down menu and press Enter.

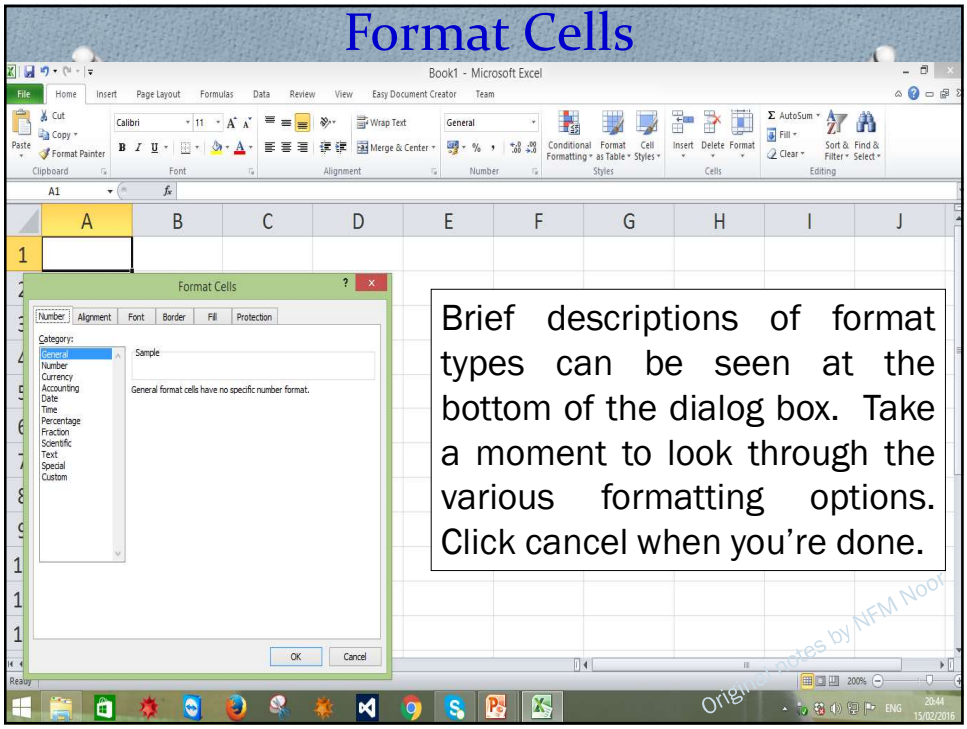

The Tool Bars and Worksheets

Cells

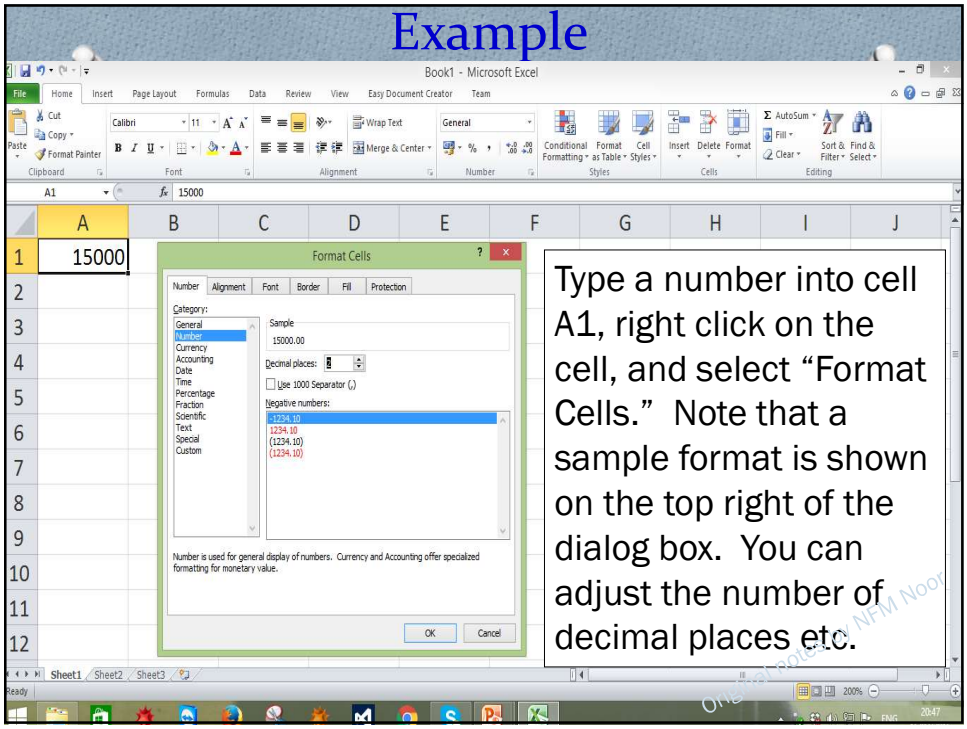

Format Cells

Brief descriptions of format types can be seen at the bottom of the dialog box. Take a moment to look through the various formatting options. Click cancel when you're done.

Example

Type a number into cell A1, right click on the cell, and select "Format Cells." Note that a sample format is shown on the top right of the dialog box. You can adjust the number of decimal places etc.

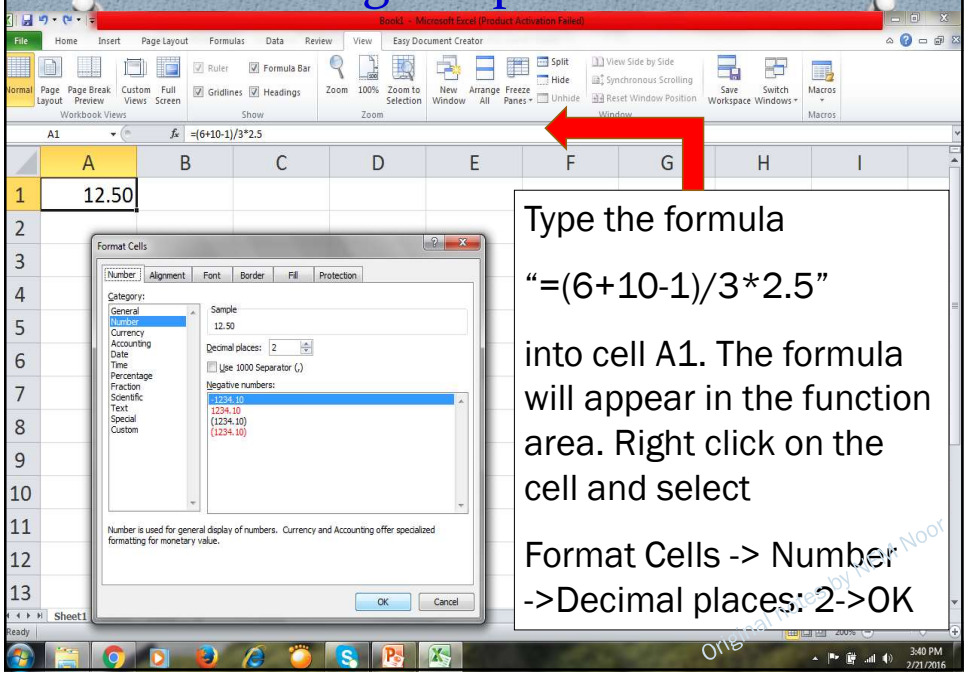

Basic Operator

- Formula can easily be created using "=" sign in any Excel cell.

Operations	Operator
Addition	+
Subtraction	-
Multiplication	*
Division	/

Original notes by NFM Noor

Writing Simple Formula

Type the formula

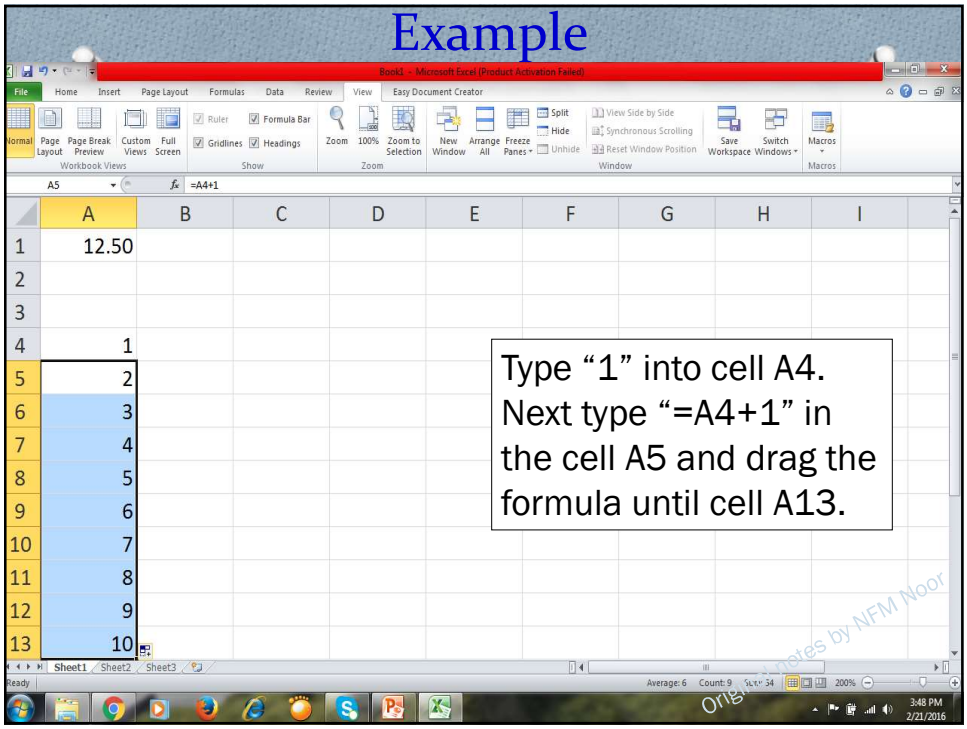

"=(6+10-1)/3*2.5"

into cell A1. The formula will appear in the function area. Right click on the cell and select

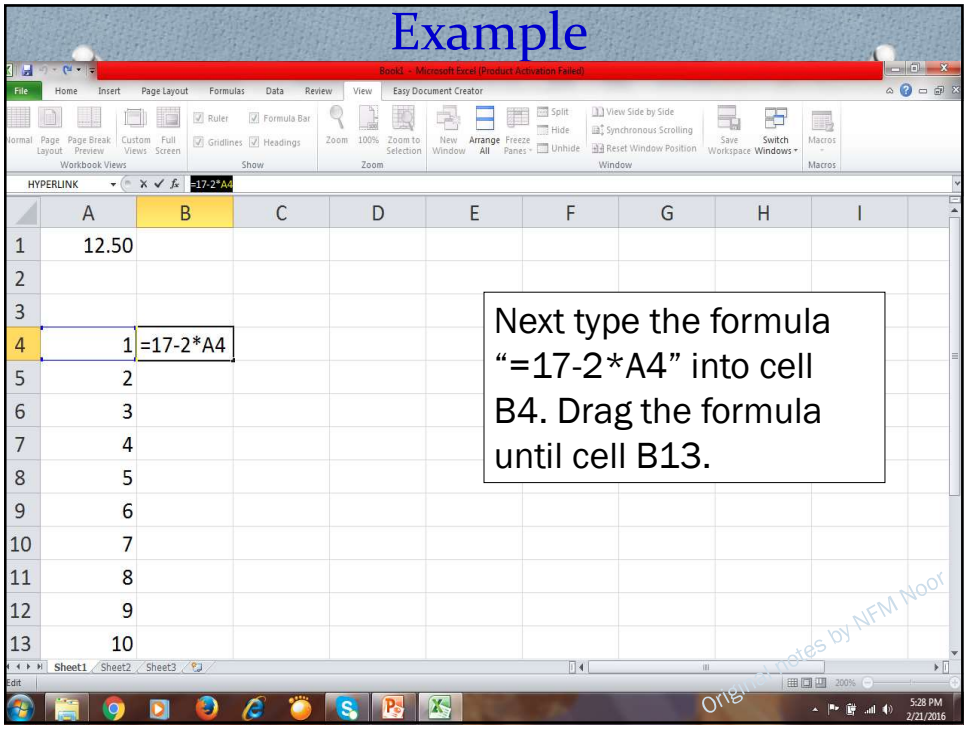

Format Cells -> Number ->Decimal places: 2->OK

Original notes by NFM Noor

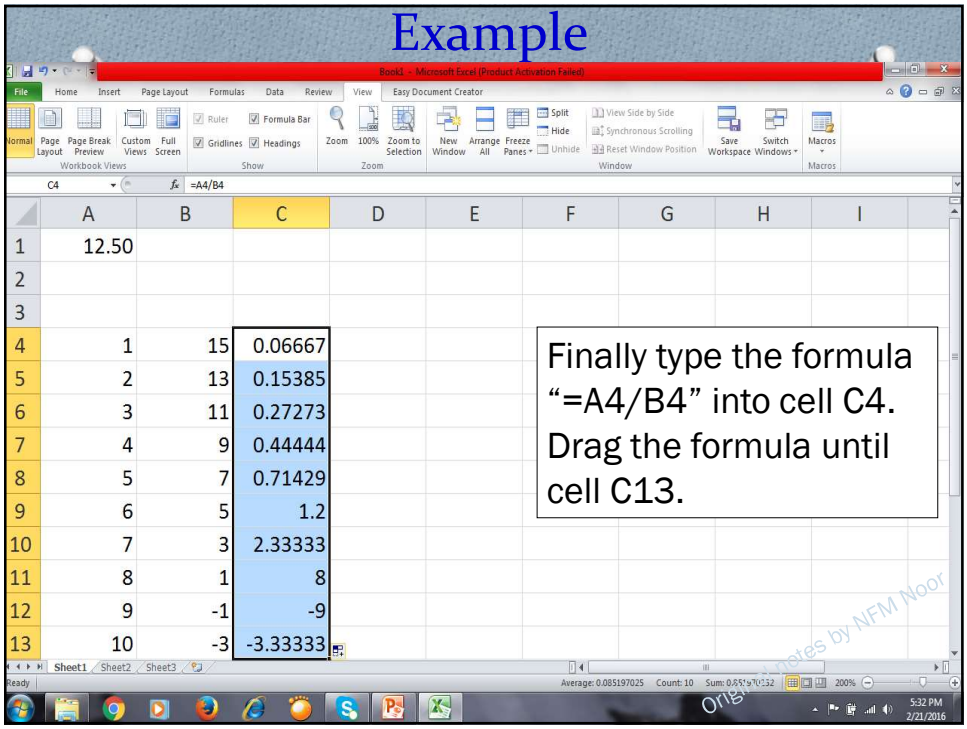

Example

Example

Example

	A	B	C
1	12.50		
2			
3			
4	1	15	0.06667
5	2	13	0.15385
6	3	11	0.27273
7	4	9	0.44444
8	5	7	0.71429
9	6	5	1.2
10	7	3	2.33333
11	8	1	8
12	9	-1	-9
13	10	-3	-3.33333

Finally type the formula "=A4/B4" into cell C4. Drag the formula until cell C13.

Original notes by NFM Noor

Summary

- A spreadsheet is a program application that manipulates numerical and string data in rows and columns of cells.
- A worksheet comprises of a sheet of multiple rows and columns used to assemble/manage figures and data.
- The combination of column and row coordinates make up a **cell address**.
- Formula can easily be created using "=" sign in any Excel cell.
